

TEST PLAN

Веб-приложение OZON

Introduction

The Test Plan includes the purpose, features to be tested, features not to be tested, test strategy, test approach, entry/exit criteria, test schedule, roles and responsibility, risk evaluation, documentation and metrics.

1. Purpose

The goal of the testing is to verify that the OZON web application (ozon.ru) user scenarios comply with the requirements specified in the "Requirement Analysis - OZON Web Application" document and function correctly from the perspective of the end user (Guest, Registered Buyer).

Testing covers functional requirements FR-1 - FR-39 (registration/authentication, catalog and search, product page, shopping cart and checkout, payment, delivery tracking, returns and claims, user account, reviews), as well as applicable non-functional requirements that can be verified externally (compatibility, basic UI accessibility).

2. Features to be tested

Feature	To testing
Registration and Authentication	Registration via phone number with SMS OTP verification; Login using a saved phone number/email or OAuth (VK ID, Apple, Госуслуги); Passwordless login (OTP-only) as the primary method; Session persistence across the website and app, with an option to log out from all devices; Account recovery via phone verification;
Catalog and search	Full-text and category search; Filters: price, brand, rating, delivery speed, location (FBO/FBS/rFBS), seller; Sorting: relevance, price, rating, discount, newness; Autocomplete and typo correction in the search bar; Navigation via category tree and breadcrumbs;
Product page	Display of price, discount, seller, delivery time and cost, and availability; Product option selection (size/color) with real-time; price/availability updates (no page reload); Display of aggregated ratings and reviews with photos/videos; "Add to Cart" and "Buy Now" actions from the product card and search results; Display of seller rating and link to the seller's storefront;
Cart and Checkout	Cart persistence across sessions for logged-in users; Grouping items by delivery/shipment method; Address selection at checkout: courier, pickup point, or parcel locker; Application of minimum order value rules for

	delivery (where applicable); Notifying the user about order splitting into multiple shipments prior to payment; Application of promo codes / bonus points (Ozon coins) at checkout;
Payment	Payment via card, CBII, Ozon Card/Ozon Bank balance, or cash/card upon delivery (where available); Payment confirmation screen displaying the order number and estimated delivery date; Behavior upon payment failure: the order is not confirmed, and the user is prompted to retry;
Order tracking and delivery	Order status tracking; Push/SMS/email notifications upon status changes; Cancellation of order/item prior to shipment; partial cancellation for multi-item orders; Rescheduling delivery or changing the pickup point prior to dispatch (where permitted);
Returns and Claims	Initiating a return from order history with reason selection; Refund status tracking;
Personal Account and Profile	Manage saved addresses, payment methods, and personal details; Order history and reordering; Notification settings;
Reviews and ratings	Reviews (text, photos, videos, ratings) can only be left after confirmed delivery or purchase; Visibility of the seller's or Ozon's response to the review; Review moderation prior to publication;
Non-functional requirements	Compatibility: major desktop and mobile browsers, responsive mobile web design; Localization: Russian locale, regional variations in pricing and delivery; Basic UI accessibility: contrast, keyboard navigation.

3. Features not to be tested

1. Seller/Partner Portal (seller.ozon.ru) - back-office functionality
2. Ozon Bank/fintech products, excluding the payment method selection at checkout.
3. Ozon Travel and Ozon Fresh as separate verticals
4. Specifics of native mobile applications (push architecture, deep links)
5. Internal architecture, backlog, and internal acceptance criteria are unavailable for analysis (C-1).
6. Logistics/warehouse systems and internal admin tooling

4. Test Strategy and Test Approach

4.1 Types and levels of testing

1. Functional testing of each area FR-1 through FR-39 (positive and negative scenarios).
2. Integration testing of end-to-end scenarios: search/product page/shopping cart/payment/order tracking.
3. Smoke/sanity testing of critical paths: registration/login, checkout, and payment.

4.2 Test design techniques

1. Equivalence classes and boundary values: for minimum order amount and OTP attempt limits.
2. Decision tables: for combinations of payment and delivery methods, and for combining promo codes with Ozon Coins.
3. Pairwise testing: for catalog filter combinations (price/brand/rating/delivery/seller)
4. Use-case-based testing: for end-to-end buyer-flow scenarios.

4.3 Test data and environments

Accounts for different roles: Guest, Registered Buyer.

A combination of FBO and FBS/rFBS items in a single cart is required to test the logic for splitting the order into shipments.

4.4 Coverage of requirements

Each functional area (2.1–2.10) must be covered by at least one positive and one negative test scenario.

5. Testing start and completion criteria

5.1 Entry criteria

1. The test environment is deployed and accessible.
2. Test data prepared (accounts with various roles)
3. Current business rules (minimum order amount, return window) are obtained from the live UI.

5.2 Exit criteria

1. All planned test cases have been executed.
2. Target requirement coverage has been achieved (at least 1 positive and 1 negative scenario per area).

6. Resources

Software: the ozon.ru test environment; other public sources (docs.ozon.ru) for verifying business rules at the time of testing.

Hardware: devices/emulators for testing mobile web responsive design and browser compatibility.

7. Risk Evaluation

1. A-1: business rules (minimum order amount, return window, fees) change periodically - risk of values hardcoded in test cases becoming outdated;
2. A-2: FBO and FBS/rFBS products may have different SLAs for the same buyer flow, creating a risk of uncovered scenarios regarding the order fulfillment method.
3. C-1: Analysis is based solely on externally observable behavior (no access to architecture, backlog, or acceptance criteria) - risk of missing edge cases visible only at the backend level.
4. C-2: commercial terms (commissions) are subject to change without notice - risk of test data and expected results becoming outdated.

5. Mixing FBO and FBS items in a single cart and its impact on order splitting requires a dedicated live test; prior to such testing, the behavior is considered hypothetical.
